door to your safety

Production facility and headquarters in Katowice

Production facility "CAPEK" in Skrzyszów

DELTA is a family company founded in 1992 by Zbigniew Różycki.

From the beginning of its existence, the company dealt with woodwork with a focus on mechanical protection, mainly anti-burglar doors and locks.

Currently, the DELTA Zbigniew Różycki brand is recognized throughout the country as a leading Polish manufacturer of anti-burglary, fire and smoke-proof doors and doors with increased acoustic or thermal insulation.

29 years of experience, the use of innovative technologies and a professional team of employees ensure the high quality of our products.

AWARDS AND DISTINCTION

The award of the Poznań International Fair „Gold Medal Budma 2020” expert selection for Delta Magnym 58K doors

The „Consumer Quality Leader 2018” distinction for the external entrance door

Award under the patronage of the Ministry of Infrastructure and Development „Orły Polskiego Budownictwa” 2015

The title of Forbes Diamond 2020

Eurel Hermes „Golden Payer 2017” certificate for maintaining the highest payment standards

The award of the Poznań International Fair „Gold Medal Budma 2015” consumer choice for Delta Magnym 68K doors

Winner of the „Economic Award of the President of the Republic of Poland” in the category of “Leader of Small and Medium Enterprises” 2019

„Gepard Biznesu” awarded by the Business institute in Warsaw in 2016

The award of the Poznań International Fair „Gold Medal Budma 2014” consumer choice for Delta Magnym 68K doors

Laureate of the XXIX edition of the „Teraz Polska” competition for the doors from the Delta Magnum series in June 2019

„Diamond of the Polish Economy” awarded by the Institute of European Business in Warsaw in 2016

The „Customer Laurel 2012” distinction

ATTENTION:

1. Due to technical limitations of the printing machines, the designs and colors presented may differ from the actual ones.
2. Due to the time gap between successive editions of the DELTA company catalogue and due to modifications of products and documents related to their improvement, the manufacturer reserves the right to change without prior notice.
3. This publication is not an offer in the mean of the law and is for information purposes only.
4. The manufacturer guarantees a 24-month warranty for products sold together with authorized assembly or a 12-month warranty in case of sale without assembly. The warranty terms and assembly instructions are included in the product warranty card.
5. The manufacturer declares the above features of the products only if the door is correctly installed and with correct equipment.
6. Commonly used terms (anti-burglary, fire-proof, smoke-proof, energy-saving, acoustic etc.) have only informational character, whereas the detailed features of the product are specified in the National Technical Approvals Certificates, ITT research and Declarations of Performance.
7. The given prices are net prices, to which 23% VAT should be added.

PROTECTION AGAINST NOISE – ACOUSTIC INSULATION

dB
27

Ten years ago, 99% of customers buying doors (no matter whether the door was intended for a single-family house or a block of flats) did not pay much attention to acoustic insulation of the door, and the deciding factor when choosing the door was their price, aesthetics or resistance to burglary. It often happened that customers with higher requirements (especially in buildings from the so-called big slab) installed double doors. Currently, in addition to doors that meet the requirements of building regulations ($R_w = 27\text{dB} - 30\text{dB}$) the customer has possibility of buying a door with parameters from so-called Top shelf with $R_w = 40\text{dB}$ (door Master 56KR) to 46dB (door Magnum68KR) after

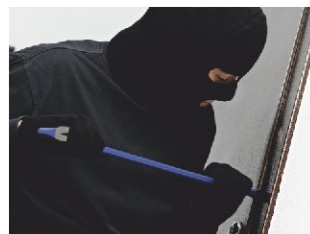

payment for additional cost. This possibility is caused by the fact that the company has its own original (patent application) technology for the production of special fire-and soundproof so-called acoustic panel WKW, for which the company received two gold medals during International Fair Budma 2014 and 2015. The best comparison we have between door Premium 56S and Magnum 56K, which are identical in construction but differ with the filling. The difference in acoustic insulation of 16 dB means almost five times better protection against noise.

PROTECTION AGAINST BURGLARY

RC3

There is no anti-burglary door! This is name used only colloquially. The only correct and legal term is the term "door with increased burglary resistance" class RC according to norm EN1627. Moreover, the increased resistance of the door to burglary depends on the tools the burglar uses, and the time needed to open the door with the help of these tools. An important factor is what kind of room will the door protect: with low, medium or high risk of burglary.

Norm UE (EN 1627) classifies doors (in terms of resistance to burglary) in classes from 1 to 6. In general, in houses and in technical rooms below mentioned doors are used:

Class RC1 - without burglary resistance tests – could be open with a kick, shoulder or otherwise using the strength of human muscles.

Class RC2 - they protect the room min. 3 minutes before a burglar equipped with a screwdriver, hammer or pliers only.

Class RC3 - they protect the room min. 5 minutes against the experienced burglar, equipped with a steel crowbar, screwdrivers, a hammer, a mechanical drill and wedges.

Class RC4 - they protect the room for min. 10 minutes against an experienced burglar, equipped - in addition to the tools from the class 3 - with a heavy hammer, saw, chisel and ax

It needs to be highlighted that above given burglary times are taken from the research standards and refer to the "experienced burglar". These are net times, meaning that do not take into account the time needed to change tools or time to analyze unexpected situations during the burglary. In practice, burglary times with the methods above are 2 or 3 times longer, which means that the RC2 class doors can surprise the occasional burglar and discourage him from further forcing the door. On the other hand, RC3 and RC4 class doors are for the burglars an unexpected barrier that requires either too much time to force them or the use of noisy tools that can draw neighbours attention, which means effective protection. There is no perfect, especially one way of protection. The optimal solution is mechanical protection (door), electronic protection (alarm), insurance and a good neighbor. It should also be noted that only the doors in the RC3 class are considered to be truly anti-burglary, because the polish insurance company PZU only from this class of doors provides customers with maximum discounts in house- or flatinsurance. Many people wrongly think that thieves try to break in at night, or when homeowners are on vacation. It turns out that they also are intensively active during the day when residents are at work or just for a few hours they are not at home. Statistics from 2014 regarding break-ins into homes and apartments, differentiated in the way the burglar got into the building, show that home burglaries done through the front door make up 38% of all attempts to break in and statistics concerning apartments reach level of more than 50%. Other ways of break-ins are windows, balconies, gates and basements.

PROTECTION AGAINST HEAT LOSSES - THERMAL INSULATION

Rising energy prices, the fight against smog and changes in regulations impose on customers the obligation to use building materials (including doors) with better and better energy-saving parameters. The use of door with $U_d = 1,6 \text{ W/m K}$ instead of door with $U_d = 0,8 \text{ W/m K}$ means almost double loss of heat through the door at the difference between outside and inside temperature of 1°C . It should also be remembered that the biggest heat loss (apart from improper assembly) is caused by bad sealing and the use of one-piece steel frames with the so-called cold profile. Delta Zbigniew Różycki company, in response to the market demand, offers energy-saving doors with the Termo ODS wood-and-steel door frame system (page 43), which thanks to the original solutions (patent notification) combines the advantages of energy saving, anti-burglary and fire protection.

U_d 
1,3

The place of installing of the door, thermal insulation factor U_d :

- Doors installed between heated rooms (eg. in block of flats) or doors installed in unheated rooms, (eg. bower for garden equipment): thermal insulation of the door is not important and there are no requirements in this area.
- Doors installed in renovated houses between heated and unheated rooms: the importance of the thermal insulation of the door depends on the energy balance of the building. It is recommended to assembly external door with $U_d \leq 1,3 \text{ W/m K}$ but decision about the insulation class of the door belongs to the investor. Minimum requirements are defined by the regulations that were in force on the day of the building permit for the renovated house because you do not lose your acquired rights (recommended doors Delta Universal 56S, Premium 56S, Magnum 56K)
- External doors for new buildings installed between heated and unheated rooms: if the building permission was obtained in 2017-2020, the door must have $U_d \leq 1,5 \text{ W / m K}$, and from January 2021 the door must have $U_d \leq 1,3 \text{ W / m K}$ (recommended door Special 56S)
- Energy-saving and passive doors: it is commonly accepted that energy-saving doors are those that have $U_d \leq 1,2 \text{ W / m K}$ (recommended for Delta Special 68S, Perfect 68X, Perfect 68XL, Exclusive 84P i Royal 84P doors), while the so-called passive doors have $U_d \leq 0,8 \text{ W / m K}$ (recommended door Delta Royal 84P)

FIRE PROTECTION

The need to install fire-proof or smoke-proof doors become obvious when during designing of investment the firefighter applies to the project comments on the fulfillment of building regulations with regard to fire protection. These regulations have usually been introduced as a result of some tragedy associated with the fire of a hall, hotel or other building when it turned out that if rooms or passageways were equipped with fire doors and other elements of the fire protection, the consequences of the tragedy could have been smaller or the tragedy could have been avoided because there would have been more time for evacuation. In many countries (regardless of the need to install fire doors in new buildings), the regulations require the installation of fire doors even when replacing old entrance doors in blocks of flats.

 EI_{230}

 S_a
 S_{200}

Fire doors are classified according to two parameters: E - fire integrity and I - fire insulation. For example, EI_{30} means that flames will not go over to the other side of the door for 30 minutes. In addition, door temperature (medium and maximum at some point) will not transfer the fire to the next room. Fire doors protect the room in both directions because it is not known in advance from which side a fire may start. Smoke-proof doors, the $S_a S_{200}$ symbol means that when the door is heated (it can happen even within tens of minutes), the smoke flow between the door and the door frame will be small. It should be highlighted that regardless of taking care of own safety (entrance doors to apartments, doors in escape routes, boiler room doors in single-family houses, doors to technical rooms in companies, etc.), fire doors and other accessories of the fire protection system are covered by very strict provisions of the construction law, in particular it applies to the absolute following the rules of assembly instructions and in regard to the installation of an expanding (expansion-) gasket. Delta company produces fire-proof doors EI_{230} (Magnum 56K, Magnum 86K), EI_{245} with smoke-proof S_a, S_{200} (Magnum 68KR) and EI_{260} (Royal WKW, Magnum 84K).

DOOR CONSTRUCTIONS

The values presented in the table which were obtained in the tests carried out in the notified and accredited laboratories may differ from the values declared by the manufacturer in the declaration of performance.

* given thermal insulation ranges are the result of the difference in features due to the size of the door and the use of glazing and various types of frames or fillings.

DIMENSIONS OF ASSEMBLY SLOT

Termo ALU 68: 90E - 1040 x 2100mm

Each door mounted outside the building requires a suitable roof to protect against sun and rain. They should also have a mounted bumper-door stopper to avoid hinge-breaks when opening above 90°. It is recommended to use the Termo Alu 68 door frame to avoid freezing of the frame.

GLAZING TYPES
FOR EXTERNAL DOORS

DELTA[®]

TYPES OF GLASS

REFLEX

Double glazing, transparent, tinted, with a delicate mirror effect.

DEKORMATT

Double glazing, not transparent, matt.

MIRRORED

Double glazing, transparent. The effect of the Venetian Mirrors is achieved through the difference in lighting. To achieve this effect, there must be higher light intensity outside the building than inside.

ATTENTION!

At night the effect of the Venetian mirror works exactly the other way round. It is recommended to switch on the lighting from

DEKORMAT L2, L5

Double glazing, opaque, matt with transparent stripes.

LACOBEL ÜVEG

Double glazing, outside frame made of black glass, inside frame made of INOX.

Doors with LACOBEL glazing cannot be installed in sunny places. Permanent shading of the entire door is absolutely required.

DELTA  [®]

ADJUSTABLE FRAMES PU-PR
WITH COUPLING PROFILE

Patent

Portals, adjustable doorframes

Adjustable door frame system PU-PR with coupling profile.

On special order – minimum 20 items (minimum 8 items from one direction).

Portals, adjustable door frames on sale ONLY on request, after agreement with the Sales Office of Delta company.

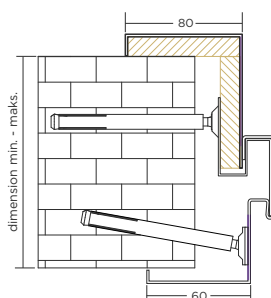

The recommended assembly hole for doors 90E for the following frames and portals is 1020 x 2080 mm from the zero level. The portals are dedicated only to inward opening doors. The minimum width of the wall on which the door frame is mounted to the doors with portal is 150 mm.

Can be installed after finishing work.

Adjustable frames

Made of sheet metal coated with PVC foil in colour selected from the manufacturer's offer.

Steel door frames profile PU, PD i PM / Termo ODS

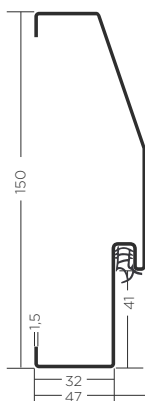

The DELTA steel frames are made of high-quality galvanized sheet 1.2 (Universal 56S, Master 56KR, Special 68S) or 1,5 mm (other models), covered with PCV laminate in the color of the door. These are cold profiles.

ATTENTION! Low outdoor temperatures, increased humidity and poor ventilation in the interior of the house may cause frosting or sweating (moisture condensation) of PU and PD steel frames made of a one-piece profile inside the building. To limit this, DELTA company as the first one on the market put on sale warm wooden and steel frame Termo ODS, with a technical partition.

Price list look P. 63: ADDITIONAL ACCESSORIES

The Termo ODS warm wooden and steel door frame system is Delta's original solution, through to its innovative combination of glued wood and two independent profiles (different thicknesses) of laminated sheet allows the use of the above door frames for energy-saving, anti-burglary and fire-proof doors. This system can also be extended with fanlights and extensions. The functional features of the system are described for each types of doors.

door frames Termo ALU

extensions of door frame Termo ALU

NEW

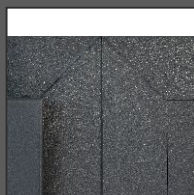

The Termo ALU warm aluminum door frames system is recommended for external doors with side and top fanlights (P. 58-59). This ensures a perfect fit of the door frame profiles, fanlights and extensions. We can use them in 68 mm thick door models (Special 68S and Perfect 68XL) and in 84 mm thick doors (Exclusive 84P). There is thermal insulation inside the Termo ALU profile, preventing the door frame from freezing at low temperatures in the winter.

Adjustment of the handle tongue pressure and the main lock's trigger hole in the Termo ALU door frame

Adjustment of the auxiliary hook lock pressure

Connection of the TERMO ALU door frame profile with the TERMO ALU fanlight profile

Hinge and anti-burglary bolt socket of the TERMO ALU 84 door frame

Electrical lock in the door frame Termo ALU

Fanlight Termo ODS

We can use them in the doors with a thickness of 68 mm (Special 68S and Perfect 68X) and 84 mm (Royal 84P)

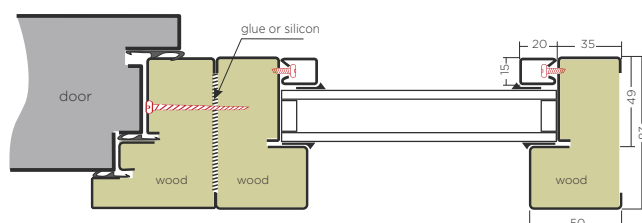

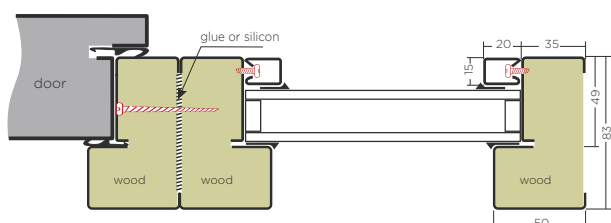

The frame of the fanlights is made of a combination of coniferous glued wood and steel sheet in the color of the door, like the wooden frames of Termo ODS type.

Safety glass with a thickness of 29 mm, 2-glass package.

Thermal transferability of the glass is $U_g = 1,1 \text{ W} / (\text{m}^2\text{K})$.

We offer glass from the outside REFLEX, DECORMAT, MIRRORED or DECORMAT L4.

Considering the combination of many elements of PCV laminated sheet (fanlights, door frames, doors) with a thickness of 0.5mm, 0.7mm and 1.5mm coming from variety of supplies - there may be differences in shades and PVC film structure which is not a defect of the product.
- Top fanlights are available with

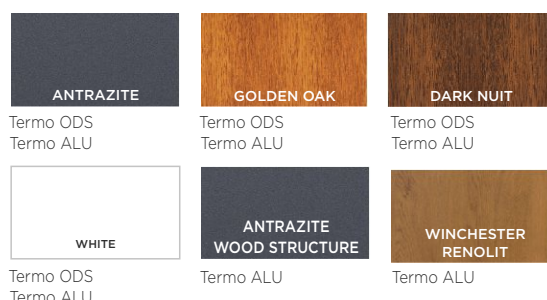

Fanlight types Termo ODS i Termo ALU:

E 50cm	2000 x 2380mm	PRICE	PRICE

Available colors for fanlights Termo ODS i Termo ALU:

The fanlights are designed for rooms with low or moderate danger of burglary.

The door frame and fanlights are designed to be put on the level of finished floor.

The edges of the bottom of the side fanlights and the finished floor must be insulated with a material like sanitary silicone or montage glue that rainwater can not get into the room.

Tolerance of dimensions: up to 1m+/-1mm, more than 1m+/-2m.

Top fanlights are available with glass: REFLEX, MIRRORED, DECORMAT.

ATTENTION!!!

Installation of the fanlights DELTA removes the validity of the burglary resistance certificate obtained for the door itself.

It provides a perfect fit of the fanlight and door frame profiles in the DELTA Termo Alu system.

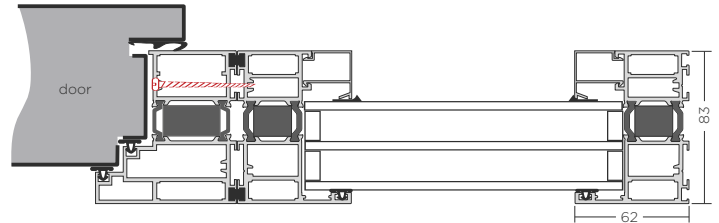

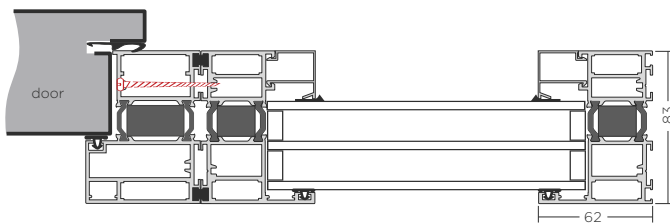

We can use them in the doors with a thickness of 68 mm (Special 68S and Perfect 68X) and 84 mm (Royal 84P)
There are special insulating materials and so-called thermo-breaks inside the TERMO ALU profiles that prevent fanlight from freezing at low temperatures.

If the hole in the wall is too wide it is possible to use 50 mm wide TERMO ALU extension.

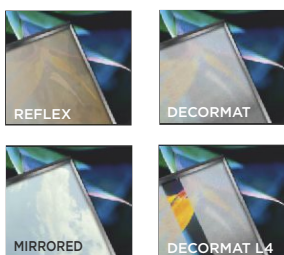

Safety glass with a thickness of 49 mm, 3-glass package.

Thermal transferability of the glass is $U_g = 0,6 \text{ W/(m}^2\text{K)}$.

We offer glass from the outside REFLEX, DECORMAT, MIRRORED or DECORMAT L4.

Inox fittings from stainless steel and aluminium

Fittings from INOX stainless steel and anodized aluminum, found in the Delta standard door, are characterized by high resistance to atmospheric factors.

ATTENTION! It is recommended that replacement fittings will be installed during the building of the house because long contact with building materials (cement, lime, gypsum etc.) may cause local discoloration and numerous surface scratches. It is obligatory to maintain and clean of door fittings of the external door immediately after assembly and on average twice a year (manual alongside). INOX and ALU door hardware available in silver colour and some models in black matte.

Handrails

The A2 handrail use the handle holes and the rosette of the upper lock in the door. From the inside there is a classic door handle and TAMARA'2 INOX information plate. When using the INOX handrail or the rigid door handle in the Delta door opening the door from the outside is possible only by turning the bottom lock with the key. We recommend using an electromagnetic lock with DAY / NIGHT function that allows you to open the door without using a key.

ATTENTION! It is recommended that replacement fittings will be installed during the building of the house because long contact with building materials (cement, lime, gypsum etc.) may cause local discoloration and numerous surface scratches.

For all handles electro-catch with the DAY / NIGHT function can be used

How to clean, care for and maintain door fittings, including INOX fittings?

- Wipe always in accordance with the direction of sanding with a sponge, with a soft cloth and preferably abrasive cloth for stainless steel.
- Use for cleaning, for example, CIF milk or stainless-steel cleaning products available on the market.
- Use for cleaning, for example, CIF milk or stainless-steel cleaning products available on the market.
- You can also use the "GREENTEQ" stainless steel cleaning and care product, which is in our additional accessories (see catalog Delta - additional accessories)
- Immediately after installing the door and after each wash, use the technical vaseline or at least edible or motor oil.
- Apply a small amount on a soft cloth and wipe all metal elements, like door handles, back plate, locks, inserts, hinges and INOX frames

Cleaning and maintenance must be carried out after the door has been installed and at least twice a year, in spring and autumn.

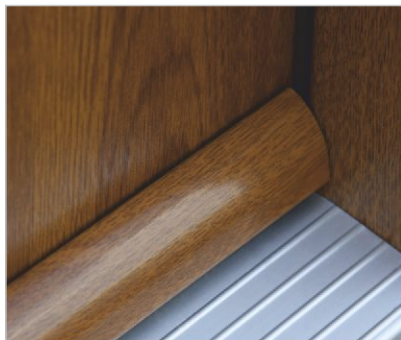

Improper care or improper use:

Do not use for polishing, under the threat of losing the warranty:

- Wire brushes, steel brushes.
- Polishing pastes, scratching powders.
- Cleaning agents containing hydrochloric acid, chlorine, bleaches.

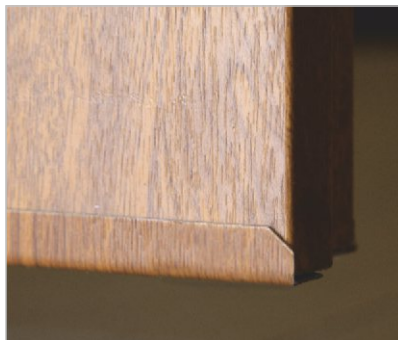

While during construction works, it is absolutely necessary to protect stainless steel elements against coating damages and scratches by lubricating with oil or technical vaseline and putting on a protective film. After completion of construction works, take care and maintain as described above. Do not weld near stainless steel elements, do not cut with an angle grinder and do not dust with other coatings and steel dust, because it is these impurities depositing on the surface of stainless steel elements that corrode.

DRIP PROFILE

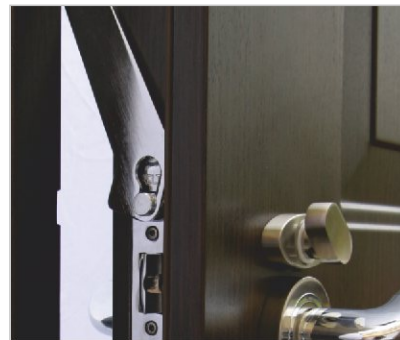

For doors opening inside the room. It improves water tightness. During assembly, the top must be insulated with colorless silicone.

BOTTOM CLOSING PROFILE

The closing profile on the underside of the door after the shortening of the door or to Delta door exposed to difficult usage conditions. It prevents waving and delamination of the underside of the door, strengthens and stiffens its structure.

OPENING LIMITER (RIGID CHAIN)

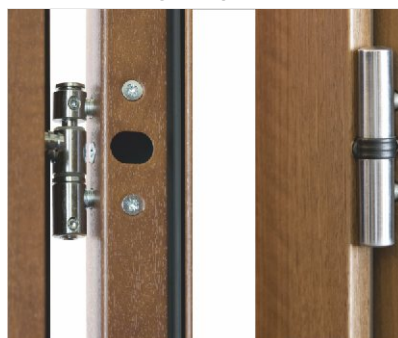

Door chain can be used in following models PREMIUM 56S, MASTER 56KR i MAGNUM 56K. It allows to open the door for about 7 cm. It can not be used in models other than those mentioned above. It can not be used with Termo ODS56 door frames, Tamara2 Inox and Alex Alu handles and with electromagnetic lock.

SELF-CLOSING HINGE DELTA PREMIUM

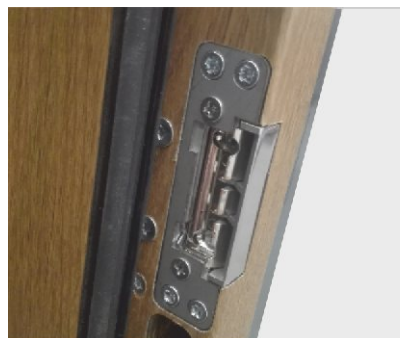

The self-closing hinge is mainly used for doors MAGNUM 56. In fire-proof door is used as an option without extra charge. It can also be used in other models except UNIVERSAL 56S for an extra charge. It can not be used in combination with the DC6/Z roller lock in the door leaf.

ADJUSTABLE HINGE DELTA PREMIUM R 3D

PREMIUM R adjustable hinges can be used in all models except UNIVERSAL. They allow you to lift the door up to 3mm without having to remove it from the frame (as in case of standard hinges).

ELECTRO CATCH 12V TO ASSEMBLY IN DOOR FRAME

Electro catch with DAY / NIGHT function 12V AC / DC with assembly in PU and PD steel frames as well as wood and steel Termo ODS. It is used on most DELTA door models. It also allows you to open the door with the installed handrail, without the use of a key. Electric strike can not be used in the door frames with PD profile.

CYKLOP DOOR VIEWER

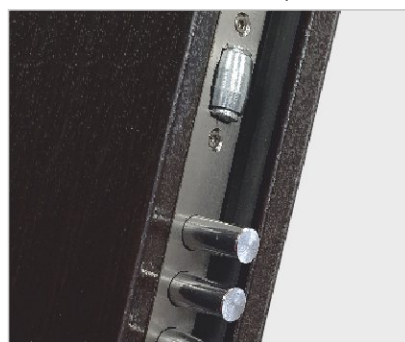

For Delta fire-proof doors MAGNUM series and other doors. The angle of view without deformities up to 160.

DELTA FDV FIRE-PROOF DOOR VIEWER

DELTA FDV viewfinder applies to fire-proof doors Delta MAGNUM. The angle of view without deformities is 120.

ROLLER MORTISE LOCK DC6/Z -LOCK

DC6/Z roller mortise lock can be used when a handrail or a stiff knob is attached to the door. It allows to open the door without using a key. It cannot be used with a door closer or self-closing hinge.

UNDER-DOORSTEP WARMING

Under-threshold warming XPS is used only to the door frames Termo ODS in exterior doors. The thickness of the insulation is 5 cm and can be multiplied.

BUMPER (STOPPER)

Bumper (stopper) limits door opening above 90 degrees, recommended for doors opening outwards to avoid breaking the door on the front elevation. Height 47mm, diameter 36mm.

DOOR CLOSER

Self-closing device Delta OUDE (as standard for the fire-proof door MAGNUM 56) or GEZE2000 (as standard for fire-proof door MAGNUM 68KR and ROYAL 84WKW), available in silver colour. Can be used for other models, with extra charge.

ELECTRONIC DOOR VIEWER

An electronic peephole with DDS-2 internal memory can be used for all door models from the DELTA offer. It has a 3.2" LCD screen and a bell function, which saves up to 50 pictures when pressed.

STAINLESS STEEL CLEANER

Spray with a capacity of 400ml recommended for cleaning, care and maintenance of metal fittings, frames and INOX stainless steel applications.

LOCK SPRAY

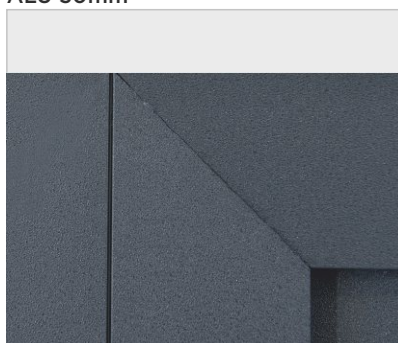

For maintenance of inserts and locks. LOCK SPRAY capacity: 25 ml.

CONTACT SENSOR

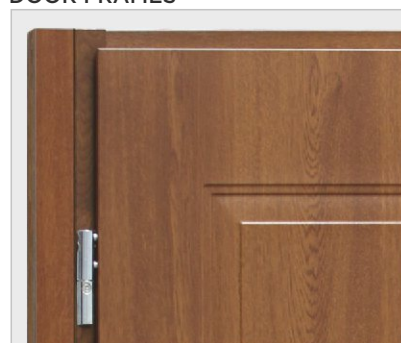

It is mounted in the door and door frame and is connected to the alarm system.

EXTENSIONS DOOR FRAMES ALU 50mm

Termo ALU extensions with a width of 50 mm are used to maneuver the dimensions of the width and height of ODS door frames. They are available in the following colors: ANTHRACITE, WHITE, DARK NUT, GOLDEN OAK. The total height of the profile: 2076 mm. Technical schemes - see page 57.

EXTENSIONS FOR WOODEN-STEEL DOOR FRAMES

Extension ODS with a width of 25mm and 50mm is used to maneuver dimensions of the width and height of ODS frames. They are available in the following colors: ANTHRACITE, WHITE, DARK NUT, GOLDEN OAK. The total height of the profile: 2076 mm. Technical schemes - see page 57.

The Delta GI20 electronic handles opened with a digital code, keyring or proximity card and Delta GZF opened by means of a fingerprint or digital code are especially recommended for flats and office rooms **inside buildings**.

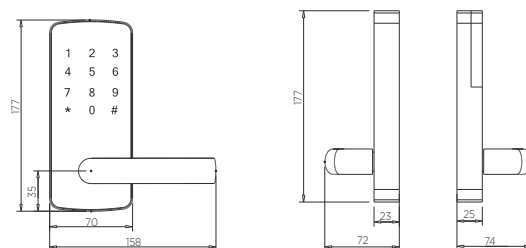

They can be used wherever we do not want to carry a key, and there is no increased risk of burglary. The system only blocks the operation of the external handle, which is unlocked from the latch (tongue) of the lock. You can open the door from the outside at any time using the profile insert key or from the inside using the inner handle. Closing with the key of the profile insert causes the slide bolt to be pulled out mechanically, which makes it impossible to open the door without using the profile insert key. DELTA electronic door handles can be used for any DELTA door model inside the building and for most other manufacturers' doors available on the market.

ATTENTION! When ordering electronic handles, always specify the direction of opening the door, for example: right, opening inwards.

Delta GI20 electronic knobs: can be opened using a digital code, a proximity key and an application on the phone via Bluetooth, and the Delta GI20-FP version is additionally opened using a fingerprint scan.

Electronic knobs in the GI20 version are intended for apartments and offices inside and outside buildings (in doors exposed to weather conditions), and the GI20-FP version with a fingerprint reader is intended only for doors installed inside buildings.

These devices can be used wherever we do not want to carry a key with us, and there is no increased risk of burglary. The knob does not control the lock bolts. To open and close the lock bolts, it is still necessary to use a mechanical key for the profile insert, the knob only enables the main lock latch (tongue) to be withdrawn, as is done by the door handle, but after correct user identification and turning the knob. In addition, after installing the GI20 knob, it is also possible to open the door only with a key to profile insert - as in the case of classic hard knobs or handrails - so without using an electronic knob.

Closing the profile insert with a key causes the mechanical slide out of the bolt (lock bolts), which prevents any opening of the door without the use of a profile insert key. The DELTA GI20 and GI20-FP electronic knobs can be used with any DELTA door model, for most doors of other manufacturers available on the market without the need to drill an additional hole for electric wires, because the electricity is transported to the other side of the door leaf by means of insulated screws with which both knobs are screwed.

Caution!!! Failure to put insulation sleeves on the screws will result in a short circuit and damage to the device and the loss of warranty.

The Delta GI20 knob is operated and programmed via the TTLOCK application on the smartphone - available for download in the IOS and Android versions and is also available in Polish. With the app, you can manage multiple knobs at home or company. Installation of the Delta GI20 electronic knob and the basics of its operation and programming is available on our website www.delta.net.pl.

COMFORT

Open the door with your smartphone.

Control and check the door lock from anywhere with the phone app. Share digital keys with relatives, employees or tenants. Thanks to this smart solution, you eliminate the risk of losing the key and unauthorized copying.

You can access the event log to open and close the door. Stay in full control of the entrance to your own home.

EFFICIENCY

You don't need to buy and replace conventional batteries. Thanks to the lock's extremely low power consumption and the long-lasting rechargeable battery, you can operate the lock for up to 14 months on a single charge, then charge it overnight.

DESIGN

The smart lock insert is mounted inside, making it unrecognizable from the outside, and the lock insert remains protected against mechanical influences. Elegant, attractive appearance is suitable for the entrance to any apartment and office. Small, smart and efficient.

TEDEE SMART LOCK INSERT PRICE 

Tedee kit contents:

1. Intelligent lock with built-in battery
2. Wi-Fi bridge
3. Cylinder insert with 3 keys
4. USB charger
5. Micro USB cable

Attention!

To run it, you need to download the mobile application. Opening from the outside is always possible with a conventional key.
